Analyse des performances:

Suite aux données des screenshots et rapports de performance en amont de ce rapport, dans cette partie j'analyse les performances d'une application web avec Lighthouse. Je souhaite vérifier que la conversion en librairie et des autres plugins jQuery en composants React améliorera les performances et la stabilité. Je mesure ici les données quantifiables telles que les temps de chargement des pages, les appels réseau pendant l'exécution de l'application. Pour m'assurer que la conversion de l'application react améliore effectivement les performances. Pour cela j'ai fait un audit de performance Lighthouse. Avant de faire l'analyse j'ai bien build les applications et je les ai lancées en navigation privée. Les appels réseau et toute cette manipulation DOM nécessaire pour les plugins jQuery s'additionnent et ralentissent l'application. En plus d'être présenté en amont les rapports de performance sont au format JSON. Comme on peut le voir les rapports de performance montrent les visuels indiquant l'état de performance, et permet de déterminer si la performance ou non a changé après la conversion et comment.

Les screenshots présentent les versions avant et après sur les deux pages de création d'employé et de la liste des employées en version desktop/mobile. On constate que sur les deux pages la version jQuery obtient un score de performance de 98 et 100 contre 100 et 100 sur la version React. Si l'on étudie plus en profondeur les temps on obtient de meilleurs temps de chargement de page (0,4s contre 0.8s) sur la version React que sur la version jQuery également. Il en est de même pour les appels réseau ou on obtient moins d'appels réseau et moins de requêtes sur la version react (7 requêtes pour react contre 11 requêtes pour jquery, taille en kb et temps de réponse en ms plus faible également).

Conclusion:

La version JQuery a des performances de base qui sont bonnes (temps de chargements) mais l'accessibilité, la SEO et bonnes pratiques sont loin des 100%. Après avoir build la version react et lancer en version navigation privée, j'optimise la version React suite aux conseils lighthouse (utilisation debugging, inspection du DOM, console, devtools, optimisation code etc). J'obtiens un score similaire de 100% pour les performances après l'ajout du data fetching at caching Suspense et Lazy de React. Pour obtenir un score de 100% en accessibilité je corrige également les soucis de contraste. On obtient aussi de meilleurs temps de chargement de meilleurs temps concernant les données sur les appels réseaux pendant l'exécution de l'application. J'obtiens donc une version 100% sur tous les critères (Performance, SEO, accessibilité, bonnes pratiques) pour la version REACT sur les deux pages. J'ai détaillé les temps de chargement et les temps des données sur les appels réseaux avant et après dans le rapport.
